could have written the `chickenize` macro.*«  
Paul Isambert

# chickenize

Arno Trautmann  
[arno.trautmann@gmx.de](mailto:arno.trautmann@gmx.de)

July 29, 2011

This is the package `chickenize`. It allows you to substitute or change the contents of a  $\text{Lua}\TeX$  document,<sup>1</sup> but is actually just for fun. Please *never* use any of the functionality of this package for a production document. The following table informs you shortly about some of your possibilities and provides links to the Lua functions. The  $\TeX$  interface is presented [below](#).

function/command	effect
<a href="#">chickenize</a>	replaces every word with “chicken”
<a href="#">colorstretch</a>	shows grey boxes that depict the badness and font expansion of each line
<a href="#">leetspeak</a>	translates the (latin-based) input into 1337 5p34k
<a href="#">randomucl</a>	changes randomly between uppercase and lowercase
<a href="#">randomfont</a>	changes the font randomly between every letter
<a href="#">randomchar</a>	randomizes the whole input
<a href="#">randomcolor</a>	prints every letter in a random color
<a href="#">rainbowcolor</a>	changes the color of letters slowly according to a rainbow
<a href="#">uppercasecolor</a>	makes every uppercase letter colored

If you have any suggestions or comments, just drop me a mail, I’ll be happy to get any response!

---

<sup>1</sup>The code is based on pure  $\text{Lua}\TeX$  features, so don't even try to use it with any other  $\TeX$  flavour. The package is tested under  $\text{Lua}\TeX$ , and should be working fine with  $\text{plain}\text{Lua}\TeX$ . If you tried it with  $\text{Con}\TeX$ t, please share your experience!

## Part I

# User Documentation

## 1 How It Works

We make use of Lua $\TeX$ s callbacks, especially the `pre_linebreak_filter` and the `post_linebreak_filter`. Hooking a function into these, we can nearly arbitrarily change the contents of the document. If the changes should be on the input-side (replacing with `chicken`), one can use the `pre_linebreak_filter`. However, changes like inserting color are best made after the linebreak is finalized, so `post_linebreak_filter` is used for such things.

All functions traverse the node list of a paragraph and manipulate the nodes' properties (like `.font` or `.char`) or insert nodes (like color push/pop nodes) and return this changed node list.

## 2 How You Can Use It

There are several ways to make use of this package – you can either stay on the  $\TeX$  side or use the Lua functions directly. In fact, the  $\TeX$  macros are simple wrappers around the functions.

### 2.1 $\TeX$ Commands – Document Wide

You have a number of commands at your hand, each of which does some manipulation of the input or output. In fact, the code is easy and straightforward, but be careful, especially when combining things. Apply features step by step so your brain won't be damaged ...

The effect of the commands can be influenced, not with arguments, but only via the `\chickenizesetup` described [below](#).

**`\chickenize`** Replaces every word of the input with the word “chicken”. Maybe sometime the replaced word can be changed, but up to now, it's only chicken. To be a bit less static, about every 10<sup>th</sup> chicken is uppercase. However, the beginning of a sentence is not recognized automatically.<sup>2</sup>

**`\uppercasecolor`** Makes every uppercase character in the input colored. At the moment, the color is randomized over the full rgb scale, but that will be adjustable once options are well implemented.

**`\randomuclc`** Changes every character of the input into its uppercase or lowercase variant. Well, guess what the “random” means ...

---

<sup>2</sup>If you have a nice implementation idea, I'd love to include this!

`\randomfonts` Changes the font randomly for every character. If no parameters are given, all fonts that have been loaded are used, especially including math fonts.

`\randomcolor` Does what it's name says.

`\rainbowcolor` Instead of random colors, this command causes the text color to change slowly according to the colors of a rainbow. Do not mix this with `randomcolor`, as that doesn't make any sense.

`\pancakenize` This is a dummy so far, as I have no idea what it should do. If you have suggestions, please tell me.

`\nyanize` A synonym for `rainbowcolor`.

`\leetspeak` Translates the input into 1337 speak. If you don't understand that, lern it, n00b.

`\colorstretch` Inspired by Paul Isambert's code, this command prints boxes instead of lines. The greyness of the first (left-hand) box corresponds to the badness of the line, i. e. it is a measure for how much the space between words has been extended to get proper paragraph justification. The second box on the right-hand side shows the amount of stretching/shrinking when font expansion is used. Together the box greyness give you information about how well the overall greyness of the typeset page is.

This functionality is actually the only really usefull implementation of this package ...

## 2.2 How to Deactivate It

Every command has a `\un-`version that deactivates it's functionality. So once you used `\chickenize`, it will chickenize the whole document up to `\unchickenize`. However, the paragraph in which `\unchickenize` appears, will *not* be chickenized. The same is true for all other manipulations. Take care that you don't `\un-`anything bevor activating it, as this will result in an error.<sup>3</sup>

If you want to manipulate only a part of a paragraph, you have use the `\text-`version of the function, see below. However, feel free to set and unset every function at will at any place in your document.

## 2.3 \text-Versions

The functions of this package might be much more useful if applied only to a short sequence of words or single words instead of the whole document or paragraph. Therefore,

---

<sup>3</sup>Which is so far not catchable due to missing functionality in luatexbase.

most of the above-mentioned commands have<sup>4</sup> a `\text-version` that takes an argument. `\textrandomcolor{foo}` results in a colored `foo` while the rest of the document keeps its color. However, to achieve this effect, still the whole node list has to be traversed, so it may slow down your document, even if you use `\textrandomcolor` only once. Fortunately, the effect is very small and mostly negligible.<sup>5</sup>

Please don't fool around by mixing a `\text-version` with the non-`\text-version`. If you feel like and are not please with the result, it is up to *you* to provide a stable and working solution.

## 2.4 Lua functions

As all features are implemented on the Lua side, you can use these functions on their own. If you do so, please consult the corresponding subsections in the [implementation](#) part, because there are some variables that can be adapted to your need.

You can use the following code inside a `\directlua` statement or in a `luacode` environment (or the corresponding thing in your format):

```
luatexbase.add_to_callback("pre_linebreak_filter",chickenize,"chickenize")
```

Replace `pre` by `post` to register into the post linebreak filter. The second argument gives the function name; find a list of available functions below. You can give a label as you like in the third argument, and the last argument gives the order in which the functions in the callback are used. If you have no fancy stuff going on, you can safely use 1.

## 3 How to Adjust It

There are several ways to change the behaviour of `chickenize` and its macros. Most of the options are Lua variables and can be set using `\chickenizesetup`. But be *careful*! The argument of `\chickenizesetup` is parsed directly to Lua, therefore you are *not* using a comma-separated key-value list, but uncorrelated Lua commands. The argument must have the syntax `{randomfontslower = 1 randomfontsupper = 0}` instead of `{randomfontslower = 1, randomfontsupper = 0}`. Alright?

However, `\chickenizesetup` is a macro on the  $\TeX$  side meaning that you can use *only* `%` as comment string. If you use `--`, all of the argument will be ignored as  $\TeX$  does not pass an eol to `\directlua`. If you don't understand that, just ignore it and go on as usual.

The following list tries to keep kind of track of the options and variables. There is no guarantee for this list, and if you find something that is missing or doesn't work as described here, please inform me!

---

<sup>4</sup>If they don't have, I did miss that, sorry. Please inform me about such cases.

<sup>5</sup>On a 500 pages text-only  $\LaTeX$  document the dilation is on the order of 10% with `\textrandomcolor`, but other manipulations can take much more time. However, you are not supposed to make such long documents with `chickenize`!

**randomfontslower, randomfontsupper = <int>** These two integer variables determine the span of fonts used for the font randomization. Just play with them a bit to find out what they are doing.

**chickenstring = <string>** The string that is printed when using `\chickenize`. So far, this does not really work, especially breaking into lines and hyphenation. Remember that this is Lua input, so a string must be given with quotation marks: `chickenstring = "foo bar"`.

**leetttable = <table>** From this table, the substitution for 1337 is taken. If you want to add or change an entry, you have to provide the unicode numbers of the characters, e.g. `leetttable[101] = 50` replaces every e (101) with the number 3 (50).

**uclcratio = <float> 0.5** Gives the fraction of uppercases to lowercases in the `\randomucl` mode. A higher number (up to 1) gives more uppercase letters. Guess what a lower number does.

**randomcolor\_grey = <bool> false** For a printer-friendly version, this offers a grey scale instead of an rgb value for `\randomcolor`.

**rainbow\_step = <float> 0.005** This indicates the relative change of color using the rainbow functionality. A value of 1 changes the color in one step from red to yellow, while a value of 0.005 takes 200 letters for this change. Useful values are below 0.05, but it depends on the amount of text. The longer the text and the lower the step, the nicer your rainbow will be.

**Rgb\_lower, rGb\_upper = <int>** To specify the color space that is used for `\randomcolor`, you can specify six values, the upper and lower value for each color. The uppercase letter in the variable denotes the color, so `rGb_upper` gives the upper value for green etc. Possible values are between 1 and 254. If you enter anything outside this, your pdf will become invalid and break. For grey scale, use `grey_lower` and `grey_upper`, with values between 0 (black) and 1000 (white), included. Default is 0 to 900 to prevent white letters.

**keeptext = <bool> false** This is for the `\colorstretch` command. If set to true, the text of your document will be kept. This way, it is easier to identify bad lines and the reason for the badness.

**colorexansion = <bool> true** If true, two bars are shown of which the second one denotes the font expansion. Only useful if font expansion is used. (You *do* use font expansion, do you?)

## Part II

# Implementation

## 4 T<sub>E</sub>X file

77 \long\def\textrandomuclc#1%
78   {\setluatexattribute\randuclcattrib{42}#1\unsetluatexattribute\randuclcattrib}

```

Finally, a macro to control the setup. So far, it's only a wrapper that allows  $\TeX$ -style comments to make the user feel more at home.

```

79 \def\chickenizesetup#1{\directlua{#1}}

```

## 5 L<sup>A</sup>T<sub>E</sub>X package

I have decided to keep the L<sup>A</sup>T<sub>E</sub>X-part of this package as small as possible. So far, it does ... nothing usefull, but it provides a `chickenize.sty` that loads `chickenize.tex`. Some code might be implemented to manipulate figures for full chickenization. However, I will *not* load any packages at this place, as loading of `expl3` or `TikZ` or whatever takes too much time for such a tiny package like this one. If you want to use anything of the features presented here, you have to load the packages on your own. Maybe this will change.

```
80 \input{chickenize}
```

### 5.1 Definition of User-Level Macros

```
81 %% We want to "chickenize" figures, too. So ...
82 \iffalse
83 \DeclareDocumentCommand\includegraphics{0}{m}{
84   \fbox{Chicken} %% actually, I'd love to draw a mp graph showing a chicken ...
85 }
86 %%%% specials: the balmerpeak. A tribute to http://xkcd.com/323/.
87 %% So far, you have to load pgfplots yourself.
88 %% As it is a mighty package, I don't want the user to force loading it.
89 \NewDocumentCommand\balmerpeak{G{}0{-4cm}}{
90   \begin{tikzpicture}
91     \hspace*{#2} %% anyhow necessary to fix centering ... strange :(
92     \begin{axis}
93       [width=10cm,height=7cm,
94        xmin=-0.005,xmax=0.28,ymin=-0.05,ymax=1,
95        xtick={0,0.02,...,0.27},ytick=\empty,
96        /pgf/number format/precision=3,/pgf/number format/fixed,
97        tick label style={font=\small},
98        label style = {font=\Large},
99        xlabel = \fontspec{Punk Nova} BLOOD ALCOHOL CONCENTRATION (\%),
100       ylabel = \fontspec{Punk Nova} \rotatebox{-90}{\parbox{3cm}{\center programming\ skills}}]
101       \addplot
102         [domain=-0.01:0.27,color=red,samples=250]
103         {0.8*exp(-0.5*((x-0.1335)^2)/.00002)+
104          0.5*exp(-0.5*((x+0.015)^2)/0.01)
105        };
106     \end{axis}
107   \end{tikzpicture}
108 }
109 \fi
```

## 6 Lua Module

This file contains all the necessary functions, sorted alphabetically, not by sense.

First, we set up some constants. These are made global so the code can be manipulated on document level, too.

```
110 Hhead = node.id("hhead")
111 RULE = node.id("rule")
112 GLUE = node.id("glue")
113 WHAT = node.id("whatsit")
114 COL = node.subtype("pdf_colorstack")
115 GLYPH = node.id("glyph")
```

Now we set up the nodes used for all color things. The nodes are whatsits of subtype pdf\_colorstack.

```
116 color_push = node.new(WHAT, COL)
117 color_pop = node.new(WHAT, COL)
118 color_push.stack = 0
119 color_pop.stack = 0
120 color_push.cmd = 1
121 color_pop.cmd = 2
```

## 6.1 chickenize

The infamous \chickenize macro. Substitutes every word of the input with the given string. This can be elaborated arbitrarily, and whenever I feel like, I might add functionality. So far, only the string replaces the word, and even hyphenation is not possible.

```
122 chickenstring = "Chicken"
123
124 local tbl = font.getfont(font.current())
125 local space = tbl.parameters.space
126 local shrink = tbl.parameters.space_shrink
127 local stretch = tbl.parameters.space_stretch
128 local match = unicode.utf8.match
129
130 chickenize = function(head)
131   for i in node.traverse_id(37, head) do --find start of a word
132     while ((i.next.id == 37) or (i.next.id == 11) or (i.next.id == 7) or (i.next.id == 0)) do --
133       i.next = i.next.next
134     end
135
136     chicken = {} -- constructing the node list. Should be done only once?
137     chicken[0] = node.new(37, 1) -- only a dummy for the loop
138     for i = 1, string.len(chickenstring) do
139       chicken[i] = node.new(37, 1)
140       chicken[i].font = font.current()
141       chicken[i-1].next = chicken[i]
142     end
143   end
```

```

144     j = 1
145     for s in string.utfvalues(chickenstring) do
146         local char = unicode.utf8.char(s)
147         chicken[j].char = s
148         if match(char,"%s") then
149             chicken[j] = node.new(10)
150             chicken[j].spec = node.new(47)
151             chicken[j].spec.width = space
152             chicken[j].spec.shrink = shrink
153             chicken[j].spec.stretch = stretch
154         end
155         j = j+1
156     end
157
158     node.slide(chicken[1])
159     lang.hyphenate(chicken[1])
160     chicken[1] = node.kerning(chicken[1])    -- FIXME: does not work
161     chicken[1] = node.ligaturing(chicken[1]) -- dito
162
163     node.insert_before(head,i,chicken[1])
164     chicken[1].next = chicken[2] -- seems to be necessary ... to be fixed
165     chicken[string.len(chickenstring)].next = i.next
166 end
167
168 return head
169 end

```

## 6.2 leet

The leettable is the substitution scheme. Just add items if you feel to. Maybe we will differ between a light-weight version and a hardcore 1337.

```

170 leet_onlytext = false
171 leettable = {
172     [101] = 51, -- E
173     [105] = 49, -- I
174     [108] = 49, -- L
175     [111] = 48, -- O
176     [115] = 53, -- S
177     [116] = 55, -- T
178
179     [101-32] = 51, -- e
180     [105-32] = 49, -- i
181     [108-32] = 49, -- l
182     [111-32] = 48, -- o
183     [115-32] = 53, -- s

```

```

184 [116-32] = 55, -- t
185 }

```

And here the function itself. So simple that I will not write any

```

186 leet = function(head)
187   for line in node.traverse_id(Hhead,head) do
188     for i in node.traverse_id(GLYPH,line.head) do
189       if not(leetspeak_onlytext) or
190         node.has_attribute(i,luatexbase.attributes.leetattr)
191       then
192         if leettable[i.char] then
193           i.char = leettable[i.char]
194         end
195       end
196     end
197   end
198   return head
199 end

```

### 6.3 randomfonts

Traverses the output and substitutes fonts randomly. A check is done so that the font number is existing. One day, the fonts should be easily given explicitly in terms of \bf etc.

```

200 randomfontslower = 1
201 randomfontsupper = 0
202 %
203 randomfonts = function(head)
204   if (randomfontsupper > 0) then -- fixme: this should be done only once, no? Or at every paragr
205     rfub = randomfontsupper -- user-specified value
206   else
207     rfub = font.max() -- or just take all fonts
208   end
209   for line in node.traverse_id(Hhead,head) do
210     for i in node.traverse_id(GLYPH,line.head) do
211       if not(randomfonts_onlytext) or node.has_attribute(i,luatexbase.attributes.randfontsattrib) tl
212       i.font = math.random(randomfontslower,rfub)
213     end
214   end
215 end
216 return head
217 end

```

### 6.4 randomucl

Traverses the input list and changes lowercase/uppercase codes.

```

218 uclcratio = 0.5 -- ratio between uppercase and lower case
219 randomuclc = function(head)
220   for i in node.traverse_id(37,head) do
221     if not(randomuclc_onlytext) or node.has_attribute(i,luatexbase.attributes.randuclcattr) then
222       if math.random() < uclcratio then
223         i.char = tex.uccode[i.char]
224       else

226       end
227     end
228   end
229   return head
230 end

```

## 6.5 randomchars

```

231 randomchars = function(head)
232   for line in node.traverse_id(Hhead,head) do
233     for i in node.traverse_id(GLYPH,line.head) do
234       i.char = math.floor(math.random()*512)
235     end
236   end
237   return head
238 end

```

## 6.6 randomcolor

Setup of the boolean for grey/color or rainbowcolor, and boundaries for the colors. rgb space is fully used, but greyscale is only used in a visible range, i. e. to 90% instead of 100% white.

```

239 randomcolor_grey = false
240 randomcolor_onlytext = false --switch between local and global colorization
241 rainbowcolor = false
242
243 grey_lower = 0
244 grey_upper = 900
245
246 Rgb_lower = 1
247 rGb_lower = 1
248 rgB_lower = 1
249 Rgb_upper = 254
250 rGb_upper = 254
251 rgB_upper = 254

```

Variables for the rainbow.  $1/\text{rainbow\_step} \times 5$  is the number of letters used for one cycle, the color changes from red to yellow to green to blue to purple.

```

252 rainbow_step = 0.005
253 rainbow_Rgb = 1-rainbow_step -- we start in the red phase
254 rainbow_rGb = rainbow_step -- values x must always be 0 < x < 1
255 rainbow_rgB = rainbow_step
256 rainind = 1 -- 1:red,2:yellow,3:green,4:blue,5:purple

```

This function produces the string needed for the pdf color stack. We need values 0]..[1 for the colors.

```

257 randomcolorstring = function()
258   if randomcolor_grey then
259     return (0.001*math.random(grey_lower,greyscale_upper)).." g"
260   elseif rainbowcolor then
261     if rainind == 1 then -- red
262       rainbow_rGb = rainbow_rGb + rainbow_step
263       if rainbow_rGb >= 1-rainbow_step then rainind = 2 end
264     elseif rainind == 2 then -- yellow
265       rainbow_Rgb = rainbow_Rgb - rainbow_step
266       if rainbow_Rgb <= rainbow_step then rainind = 3 end
267     elseif rainind == 3 then -- green
268       rainbow_rgB = rainbow_rgB + rainbow_step
269       rainbow_rGb = rainbow_rGb - rainbow_step
270       if rainbow_rGb <= rainbow_step then rainind = 4 end
271     elseif rainind == 4 then -- blue
272       rainbow_Rgb = rainbow_Rgb + rainbow_step
273       if rainbow_Rgb >= 1-rainbow_step then rainind = 5 end
274     else -- purple
275       rainbow_rgB = rainbow_rgB - rainbow_step
276       if rainbow_rgB <= rainbow_step then rainind = 1 end
277     end
278     return rainbow_Rgb.." "..rainbow_rGb.." "..rainbow_rgB.." rg"
279   else
280     Rgb = math.random(Rgb_lower,Rgb_upper)/255
281     rGb = math.random(rGb_lower,rGb_upper)/255
282     rgB = math.random(rgB_lower,rgB_upper)/255
283     return Rgb.." "..rGb.." "..rgB.." .." rg"
284   end
285 end

```

The function that does all the colorizing action. It goes through the whole paragraph and looks at every glyph. If the boolean `randomcolor_onlytext` is set, only glyphs with the set attribute will be colored. Otherwise, all glyphs are taken.

```

286 randomcolor = function(head)
287   for line in node.traverse_id(0,head) do
288     for i in node.traverse_id(37,line.head) do
289       if not(randomcolor_onlytext) or
290         (node.has_attribute(i,luatexbase.attributes.randcolorattr))
291       then

```

```

292         color_push.data = randomcolorstring() -- color or grey string
293         line.head = node.insert_before(line.head,i,node.copy(color_push))
294         node.insert_after(line.head,i,node.copy(color_pop))
295     end
296 end
297 end
298 return head
299 end

```

## 6.7 uppercasecolor

Loop through all the nodes and checking whether it is uppercase. If so (and also for small caps), color it.

```

300 uppercasecolor = function (head)
301   for line in node.traverse_id(Hhead,head) do
302     for upper in node.traverse_id(GLYPH,line.head) do
303       if (((upper.char > 64) and (upper.char < 91)) or
304           ((upper.char > 57424) and (upper.char < 57451))) then -- for small caps! nice
305         color_push.data = randomcolorstring() -- color or grey string
306         line.head = node.insert_before(line.head,upper,node.copy(color_push))
307         node.insert_after(line.head,upper,node.copy(color_pop))
308       end
309     end
310   end
311   return head
312 end

```

## 6.8 colorstretch

This function displays the amount of stretching that has been done for each line of an arbitrary document. A well-typeset document should be equally grey over all lines, which is not always possible.

In fact, two boxes are drawn: The first (left) box shows the badness, i. e. the amount of stretching the spaces between words. Too much space results in light gray, whereas a too dense line is indicated by a dark grey box.

The second box is only useful if microtypographic extensions are used, e. g. with the `microtype` package under  $\text{\LaTeX}$ . The box color then corresponds to the amount of font expansion in the line. This can be greatly used to show the positive effect of font expansion on the badness of a line!

The base structure of the following code is written by Paul Isambert. Thanks for the code and support, Paul!

Two booleans, `keeptext`, and `colorexpan`, are used to control the behaviour of the function.

```

313 keeptext = true
314 colorexpan = true

```

After setting the constants, the function starts. It receives the vertical list of the typeset paragraph as head, and loops through all horizontal lists.

If font expansion should be shown (colorexpan == true), then the first glyph node is determined and its width compared with the width of the unexpanded glyph. This gives a measure for the expansion factor and is translated into a grey scale.

```

315 colorstretch = function (head)
316
317   local f = font.getfont(font.current()).characters
318   for line in node.traverse_id(Hhead,head) do
319     local rule_bad = node.new(RULE)
320
321   if colorexpan then -- if also the font expansion should be shown
322     local g = line.head
323     while not(g.id == 37) do
324       g = g.next
325     end
326     exp_factor = g.width / f[g.char].width
327     exp_color = .5 + (1-exp_factor)*10 .. " g"
328     rule_bad.width = 0.5*line.width -- we need two rules on each line!
329   else
330     rule_bad.width = line.width -- only the space expansion should be shown, only one rule
331   end

```

Height and depth of the rules are adapted to print a closed grey pattern, so no white interspace is left.

The glue order and sign can be obtained directly and are translated into a grey scale.

```

332   rule_bad.height = tex.baselineskip.width*4/5 -- this should give a better output
333   rule_bad.depth = tex.baselineskip.width*1/5
334
335   local glue_ratio = 0
336   if line.glue_order == 0 then
337     if line.glue_sign == 1 then
338       glue_ratio = .5 * math.min(line.glue_set,1)
339     else
340       glue_ratio = -.5 * math.min(line.glue_set,1)
341     end
342   end
343   color_push.data = .5 + glue_ratio .. " g"

```

Now, we throw everything together in a way that works. Somehow ...

```

344 -- set up output
345   local p = line.head
346
347 -- a rule to immitate kerning all the way back

```

```

348     local kern_back = node.new(RULE)
349     kern_back.width = -line.width
350
351     -- if the text should still be displayed, the color and box nodes are inserted additionally
352     -- and the head is set to the color node
353     if kepttext then
354         line.head = node.insert_before(line.head,line.head,node.copy(color_push))
355     else
356         node.flush_list(p)
357         line.head = node.copy(color_push)
358     end
359     node.insert_after(line.head,line.head,rule_bad) -- then the rule
360     node.insert_after(line.head,line.head.next,node.copy(color_pop)) -- and then pop!
361     tmpnode = node.insert_after(line.head,line.head.next.next,kern_back)
362
363     -- then a rule with the expansion color
364     if colorexansion then -- if also the stretch/shrink of letters should be shown
365         color_push.data = exp_color
366         node.insert_after(line.head,tmpnode,node.copy(color_push))
367         node.insert_after(line.head,tmpnode.next,node.copy(rule_bad))
368         node.insert_after(line.head,tmpnode.next.next,node.copy(color_pop))
369     end
370 end
371 return head
372 end

```

And that's it!

## 7 Known Bugs

A rather severe bug is related to Adobe's Acrobat Reader: While `randomcolor` works fine and produces a pdf, that pdf cannot be viewed using the Acrobat Reader. I have no idea so far what's the problem. However, every other pdf viewer seems to work fine here, so just use another one.

## 8 To Dos

Some things that should be implemented but aren't so far or are very poor at the moment:

`rainbowcolor` should be more flexible – the angle of the rainbow should be easily adjustable.

`pancakenize` should do something funny.
