chickenize

Arno Trautmann arno.trautmann@gmx.de

October 11, 2011

This is the package chickenize. It allows you to substitute or change the contents of a LuaTeX document, but is actually just for fun. Please *never* use any of the functionality of this package for a production document. The following table informs you shortly about some of your possibilities and provides links to the Lua functions. The TeX interface is presented below.

function/command	effect
chickenize	replaces every word with "chicken"
colorstretch	shows grey boxes that depict the badness and font expansion of
leetspeak	each line translates the (latin-based) input into 1337 5p34k
randomuclc	changes randomly between uppercase and lowercase
randomfonts	changes the font randomly between every letter
randomchars	randomizes the whole input
randomcolor	prints every letter in a random color
rainbowcolor	changes the color of letters slowly according to a rainbow
uppercasecolor	makes every uppercase letter colored

If you have any suggestions or comments, just drop me a mail, I'll be happy to get any response!

¹The code is based on pure LuaT_EX features, so don't even try to use it with any other T_EX flavour. The package is tested under LuaL^AT_EX, and should be working fine with plainLuaT_EX. If you tried it with ConT_EXt, please share your experience!

Part I

User Documentation

1 How It Works

We make use of LuaTEXs callbacks, especially the pre_linebreak_filter and the post_line-break_filter. Hooking a function into these, we can nearly arbitrarily change the contents of the document. If the changes should be on the input-side (replacing with chicken), one can use the pre_linebreak_filter. Hower, changes like inserting color are best made after the linebreak is finalized, so post_linebreak_filter is used for such things.

All functions traverse the node list of a paragraph and manipulate the nodes' properties (like .font or .char) or insert nodes (like color push/pop nodes) and return this changed node list.

2 Commands – How You Can Use It

There are several ways to make use of this package – you can either stay on the TEX side or use the Lua functions directly. In fact, the TEX macros are simple wrappers around the functions.

2.1 TeX Commands - Document Wide

You have a number of commands at your hand, each of which does some manipulation of the input or output. In fact, the code is easy and straightforward, but be careful, especially when combining things. Apply features step by step so your brain won't be damaged ...

The effect of the commands can be influenced, not with arguments, but only via the \chickenizesetup described below.

- **\chickenize** Replaces every word of the input with the word "chicken". Maybe sometime the replaced word can be changed, but up to now, it's only chicken. To be a bit less static, about every 10th chicken is uppercase. However, the beginning of a sentence is not recognized automatically.²
- **\uppercasecolor** Makes every uppercase character in the input colored. At the moment, the color is randomized over the full rgb scale, but that will be adjustable once options are well implemented.
- **\randomuclc** Changes every character of the input into its uppercase or lowercase variant. Well, guess what the "random" means ...

²If you have a nice implementation idea, I'd love to include this!

\randomfonts Changes the font randomly for every character. If no parameters are given, all fonts that have been loaded are used, especially including math fonts.

\randomcolor Does what it's name says.

\rainbowcolor Instead of random colors, this command causes the text color to change slowly according to the colors of a rainbow. Do not mix this with randomcolor, as that doesn't make any sense.

\pancakenize This is a dummy so far, as I have no idea what it should do. If you have suggestions, please tell me.

\nyanize A synonym for rainbowcolor.

\leetspeak Translates the input into 1337 speak. If you don't understand that, lern it, n00b.

\colorstretch Inspired by Paul Isambert's code, this command prints boxes instead of lines. The greyness of the first (left-hand) box corresponds to the badness of the line, i. e. it is a measure for how much the space between words has been extended to get proper paragraph justification. The second box on the right-hand side shows the amount of stretching/shrinking when font expansion is used. Together the box greyness give you information about how well the overall greyness of the typeset page is.

This functionality is actually the only really usefull implementation of this package ...

2.2 How to Deactivate It

Every command has a \un-version that deactivetes it's functionality. So once you used \chickenize, it will chickenize the whole document up to \unchickenize. However, the paragraph in which \unchickenize appears, will *not* be chickenized. The same is true for all other manipulations. Take care that you don't \un-anything bevor activating it, as this will result in an error.³

If you want to manipulate only a part of a paragraph, you have use the \text-version of the function, see below. However, feel free to set and unset every function at will at any place in your document.

2.3 \text-Versions

The functions of this package might be much more useful if applied only to a short sequence of words or single words instead of the whole document or paragraph. Therefore,

³Which is so far not catchable due to missing functionality in luatexbase.

most of the above-mentioned commands have⁴ a \text-version that takes an argument. \textrandomcolor{foo} results in a colored foo while the rest of the document keeps its color. However, to achieve this effect, still the whole node list has to be traversed, so it may slow down your document, even if you use \textrandomcolor only once. Fortunately, the effect is very small and mostly negligible.⁵

Please don't fool around by mixing a \text-version with the non-\text-version. If you feel like and are not please with the result, it is up to *you* to provide a stable and working solution.

2.4 Lua functions

As all features are implemented on the Lua side, you can use these functions on their own. If you do so, please consult the corresponding subsections in the implementation part, because there are some variables that can be adapted to your need.

You can use the following code inside a \directlua statement or in a luacode environment (or the corresponding thing in your format):

luatexbase.add_to_callback("pre_linebreak_filter",chickenize,"chickenize")

Replace pre by post to register into the post linebreak filter. The second argument gives the function name; find a list of available functions below. You can give a label as you like in the third argument, and the last argument gives the order in which the functions in the callback are used. If you have no fancy stuff going on, you can safely use 1.

3 Options – How to Adjust It

There are several ways to change the behaviour of chickenize and its macros. Most of the options are Lua variables and can be set using \chickenizesetup. But be careful! The argument of \chickenizesetup is parsed directly to Lua, therefore you are not using a comma-separated key-value list, but uncorrelated Lua commands. The argument must have the syntax {randomfontslower = 1 randomfontsupper = 0} instead of {randomfontslower = 1, randomfontsupper = 0}. Alright?

However, \chickenizesetup is a macro on the TEX side meaning that you can use *only* % as comment string. If you use --, all of the argument will be ignored as TEX does not pass an eol to \directlua. If you don't understand that, just ignore it and go on as usual.

The following list tries to keep kind of track to the options and variables. There is no guarantee for this list, and if you find something that is missing or doesn't work as described here, please inform me!

⁴If they don't have, I did miss that, sorry. Please inform me about such cases.

⁵On a 500 pages text-only LTEX document the dilation is on the order of 10% with textrandomcolor, but other manipulations can take much more time. However, you are not supposed to make such long documents with chickenize!

- randomfontslower, randomfontsupper = <int> These two integer variables determine the
 span of fonts used for the font randomization. Just play with them a bit to find out
 what they are doing.
- chickenstring = The string that is printed when using \chickenize. In fact,
 chickenstring is a table which allows for some more random action. To specify
 the default string, say chickenstring[1] = 'chicken'. For more than one animal,
 just step the index: chickenstring[2] = 'rabbit'. All existing table entries will be
 used randomly. Remember that we are dealing with Lua strings here, so use ' ' to
 mark them. (" " can cause problems with babel.)
- chickenizefraction = <float> 1 Gives the fraction of words that get replaced by the
 chickenstring. The default means that every word is substituted. However, with
 a value of, say, 0.0001, only one word in ten thousand will be chickenstring.
 chickenizefraction must be specified after \begin{document}. No idea, why ...
- colorstretchnumbers = <true> If true, the amount of stretching or shrinking of each line
 is printed into the margin as a green, red or black number.
- leettable = From this table, the substitution for 1337 is taken. If you want to
 add or change an entry, you have to provide the unicode numbers of the characters,
 e.g. leettable[101] = 50 replaces every e (101) with the number 3 (50).
- uclcratio = <float> 0.5 Gives the fraction of uppercases to lowercases in the \randomuclc
 mode. A higher number (up to 1) gives more uppercase letters. Guess what a lower
 number does.
- randomcolor_grey = <bool> false For a printer-friendly version, this offers a grey scale
 instead of an rgb value for \randomcolor.
- rainbow_step = <float> 0.005 This indicates the relative change of color using the rainbow functionality. A value of 1 changes the color in one step from red to yellow, while a value of 0.005 takes 200 lettrs for this change. Useful values are below 0.05, but it depends on the amount of text. The longer the text and the lower the step, the nicer your rainbow will be.
- Rgb_lower, rGb_upper = <int> To specify the color space that is used for \randomcolor, you can specify six values, the upper and lower value for each color. The uppercase letter in the variable denotes the color, so rGb_upper gives the upper value for green etc. Possible values are between 1 and 254. If you enter anything outside this, your pdf will become invalid and break. For grey scale, use grey_lower and grey_upper, with values between 0 (black) and 1000 (white), included. Default is 0 to 900 to prevent white letters.

keeptext = <bool> false This is for the \colorstretch command. If set to true, the text
 of your document will be kept. This way, it is easier to identify bad lines and the
 reason for the badness.

colorexpansion = <bool> true If true, two bars are shown of which the second one denotes the font expansion. Only usefull if font expansion is used. (You do use font expansion, do you?)

5 LATEX package

I have decided to keep the LATEX-part of this package as small as possible. So far, it does ... nothing usefull, but it provides a chickenize.sty that loads chickenize.tex. Some code might be implemented to manipulate figures for full chickenization. However, I will not load any packages at this place, as loading of expl3 or TikZ or whatever takes too much time for such a tiny package like this one. If you want to use anything of the features presented here, you have to load the packages on your own. Maybe this will change.

127 \input{chickenize}

5.1 Definition of User-Level Macros

```
%% We want to "chickenize" figures, too. So ...
129\iffalse
    \DeclareDocumentCommand\includegraphics{O{}m}{
130
131
        \fbox{Chicken} %% actually, I'd love to draw a mp graph showing a chicken ...
132 }
133 %%%% specials: the balmerpeak. A tribute to http://xkcd.com/323/.
134 %% So far, you have to load pgfplots yourself.
135 %% As it is a mighty package, I don't want the user to force loading it.
136 \NewDocumentCommand\balmerpeak{G{}0{-4cm}}{
    \begin{tikzpicture}
                   %% anyhow necessary to fix centering ... strange :(
    \hspace*{#2}
138
    \begin{axis}
139
     [width=10cm,height=7cm,
140
141
     xmin=-0.005, xmax=0.28, ymin=-0.05, ymax=1,
      xtick={0,0.02,...,0.27},ytick=\enclose{one}
142
143
      /pgf/number format/precision=3,/pgf/number format/fixed,
      tick label style={font=\small},
144
      label style = {font=\Large},
145
      xlabel = \fontspec{Punk Nova} BLOOD ALCOHOL CONCENTRATION (\%),
146
      ylabel = \fontspec{Punk Nova} \rotatebox{-90}{\parbox{3cm}{\center programming\\ skills}}]
147
148
         [domain=-0.01:0.27,color=red,samples=250]
149
```

```
150 {0.8*exp(-0.5*((x-0.1335)^2)/.00002)+

151 0.5*exp(-0.5*((x+0.015)^2)/0.01)

152 };

153 \end{axis}

154 \end{tikzpicture}

155}
```

6 Lua Module

This file contains all the necessary functions, sorted alphabetically, not by sense.

First, we set up some constants. These are made global so the code can be manipulated on document level, too.

```
157 Hhead = node.id("hhead")
158 RULE = node.id("rule")
159 GLUE = node.id("glue")
160 WHAT = node.id("whatsit")
161 COL = node.subtype("pdf_colorstack")
162 GLYPH = node.id("glyph")
```

Now we set up the nodes used for all color things. The nodes are whatsits of subtype pdf_colorstack.

```
163 color_push = node.new(WHAT,COL)
164 color_pop = node.new(WHAT,COL)
165 color_push.stack = 0
166 color_pop.stack = 0
167 color_push.cmd = 1
168 color_pop.cmd = 2
```

6.1 chickenize

The infamous \chickenize macro. Substitutes every word of the input with the given string. This can be elaborated arbitrarily, and whenever I feel like, I might add functionality. So far, only the string replaces the word, and even hyphenation is not possible.

```
169 chicken_pagenumbers = true
170
171 chickenstring = {}
172 chickenstring[1] = "Chicken" -- chickenstring is a table, please remeber this!
173
174 chickenizefraction = 0.5
175 -- set this to a small value to fool somebody, or to see if your text has been read carefully. Th
176
177 local tbl = font.getfont(font.current())
178 local space = tbl.parameters.space
179 local shrink = tbl.parameters.space_shrink
```

```
180 local stretch = tbl.parameters.space_stretch
181 local match = unicode.utf8.match
182 chickenize_ignore_word = false
184 chickenize real stuff = function(i,head)
       while ((i.next.id == 37) or (i.next.id == 11) or (i.next.id == 7) or (i.next.id == 0)) do ---
185
186
         i.next = i.next.next
187
       end
188
189
       chicken = {} -- constructing the node list.
190
191 -- Should this be done only once? No, then we loose the freedom to change the string in-document.
192 -- but it could be done only once each paragraph as in-paragraph changes are not possible!
193
       chickenstring_tmp = chickenstring[math.random(1, #chickenstring)]
194
       chicken[0] = node.new(37,1) -- only a dummy for the loop
195
       for i = 1,string.len(chickenstring_tmp) do
196
197
         chicken[i] = node.new(37,1)
         chicken[i].font = font.current()
198
         chicken[i-1].next = chicken[i]
199
200
       end
201
202
       j = 1
203
       for s in string.utfvalues(chickenstring_tmp) do
         local char = unicode.utf8.char(s)
204
         chicken[j].char = s
205
         if match(char, "%s") then
206
           chicken[j] = node.new(10)
207
208
           chicken[j].spec = node.new(47)
209
           chicken[j].spec.width = space
           chicken[j].spec.shrink = shrink
210
           chicken[j].spec.stretch = stretch
211
         end
212
         j = j+1
213
214
       end
215
      node.slide(chicken[1])
216
       lang.hyphenate(chicken[1])
217
       chicken[1] = node.kerning(chicken[1])
218
                                                -- FIXME: does not work
       chicken[1] = node.ligaturing(chicken[1]) -- dito
219
220
       node.insert_before(head,i,chicken[1])
221
222
       chicken[1].next = chicken[2] -- seems to be necessary ... to be fixed
       chicken[string.len(chickenstring tmp)].next = i.next
224
   return head
```

225 end

```
226
227 chickenize = function(head)

251 texio.write_nl("good job, now go outside and enjoy the world!")
252 texio.write nl(" ")
253 texio.write_nl("And don't forget to feet your chicken!")
254 texio.write_nl("-----")
255 end
```

6.2 leetspeak

The leettable is the substitution scheme. Just add items if you feel to. Maybe we will differ between a light-weight version and a hardcore 1337.

```
256 leet_onlytext = false
257 leettable = {
    [101] = 51, -- E
258
259
    [105] = 49, -- I
260
    [108] = 49, -- L
    [111] = 48, -- 0
261
    [115] = 53, -- S
262
    [116] = 55, -- T
263
264
265 [101-32] = 51, -- e
```

```
266 [105-32] = 49, -- i

267 [108-32] = 49, -- 1

268 [111-32] = 48, -- o

269 [115-32] = 53, -- s

270 [116-32] = 55, -- t

271}
```

And here the function itself. So simple that I will not write any

```
272 leet = function(head)
    for line in node.traverse_id(Hhead,head) do
       for i in node.traverse_id(GLYPH,line.head) do
274
275
         if not(leetspeak_onlytext) or
276
            node.has_attribute(i,luatexbase.attributes.leetattr)
277
         then
           if leettable[i.char] then
278
             i.char = leettable[i.char]
279
280
         end
281
282
       end
283
    end
    return head
284
285 end
```

6.3 pancakenize

Not yet completely decided what this should do, but it might come down to inserting a cooking receipe for a ... well, guess what. Possible implementations are: Substitute a whole sentence, from full-stop to full-stop. OR: Substitute word-by-word at a random place. OR (expert-freak-1337-level): Substitute the n-th word of each page to a word of the receipe. That would be totally awesome!!

6.4 randomfonts

Traverses the output and substitutes fonts randomly. A check is done so that the font number is existing. One day, the fonts should be easily given explicitly in terms of \bf etc.

```
286 \, \text{randomfontslower} = 1
287 \, \text{randomfontsupper} = 0
288 %
289 randomfonts = function(head)
290 if (randomfontsupper > 0) then -- fixme: this should be done only once, no? Or at every paragrams
       rfub = randomfontsupper -- user-specified value
291
292
     else
293
       rfub = font.max()
                                   -- or just take all fonts
294
     end
     for line in node.traverse_id(Hhead,head) do
295
```

6.5 randomucle

Traverses the input list and changes lowercase/uppercase codes.

```
304\,\mathrm{uclcratio} = 0.5 -- ratio between uppercase and lower case
305 randomuclc = function(head)
    for i in node.traverse_id(37,head) do
307
       if not(randomuclc_onlytext) or node.has_attribute(i,luatexbase.attributes.randuclcattr) then
         if math.random() < uclcratio then</pre>
308
309
           i.char = tex.uccode[i.char]
         else
310
           i.char = tex.lccode[i.char]
311
312
         end
313
       end
314
    end
315 return head
316 end
```

6.6 randomchars

```
317 randomchars = function(head)
318 for line in node.traverse_id(Hhead,head) do
319 for i in node.traverse_id(GLYPH,line.head) do
320 i.char = math.floor(math.random()*512)
321 end
322 end
323 return head
324 end
```

6.7 randomcolor and rainbowcolor

Setup of the boolean for grey/color or rainbowcolor, and boundaries for the colors. rgb space is fully used, but greyscale is only used in a visible range, i. e. to 90% instead of 100% white.

```
325 randomcolor_grey = false
326 randomcolor_onlytext = false --switch between local and global colorization
327 rainbowcolor = false
328
```

```
329 grey_lower = 0

330 grey_upper = 900

331

332 Rgb_lower = 1

333 rGb_lower = 1

334 rgB_lower = 1

335 Rgb_upper = 254

336 rGb_upper = 254

337 rgB_upper = 254
```

Variables for the rainbow. 1/rainbow_step*5 is the number of letters used for one cycle, the color changes from red to yellow to green to blue to purple.

```
338 rainbow_step = 0.005
339 rainbow_Rgb = 1-rainbow_step -- we start in the red phase
340 rainbow_rGb = rainbow_step -- values x must always be 0 < x < 1
341 rainbow_rgB = rainbow_step
342 rainind = 1 -- 1:red,2:yellow,3:green,4:blue,5:purple</pre>
```

This function produces the string needed for the pdf color stack. We need values 0]..[1 for the colors.

```
343 randomcolorstring = function()
344 if randomcolor_grey then
345
      return (0.001*math.random(grey_lower,grey_upper)).." g"
346 elseif rainbowcolor then
      if rainind == 1 then -- red
347
        rainbow_rGb = rainbow_rGb + rainbow_step
348
        if rainbow_rGb >= 1-rainbow_step then rainind = 2 end
349
350
      elseif rainind == 2 then -- yellow
        rainbow_Rgb = rainbow_Rgb - rainbow_step
351
        if rainbow Rgb <= rainbow step then rainind = 3 end
352
353
      elseif rainind == 3 then -- green
        rainbow_rgB = rainbow_rgB + rainbow_step
        rainbow_rGb = rainbow_rGb - rainbow_step
355
        if rainbow_rGb <= rainbow_step then rainind = 4 end
356
      elseif rainind == 4 then -- blue
357
        rainbow_Rgb = rainbow_Rgb + rainbow_step
358
        if rainbow_Rgb >= 1-rainbow_step then rainind = 5 end
359
360
      else -- purple

364
365
    else
366
      Rgb = math.random(Rgb_lower,Rgb_upper)/255
      rGb = math.random(rGb_lower,rGb_upper)/255
367
      rgB = math.random(rgB_lower,rgB_upper)/255
368
      return Rgb.." "..rGb.." "..rgB.." ".." rg"
```

```
370 end
371 end
```

The function that does all the colorizing action. It goes through the whole paragraph and looks at every glyph. If the boolean randomcolor_onlytext is set, only glyphs with the set attribute will be colored. Elsewise, all glyphs are taken.

```
372 randomcolor = function(head)
373
    for line in node.traverse_id(0,head) do
374
       for i in node.traverse_id(37,line.head) do
375
         if not(randomcolor_onlytext) or
376
            (node.has attribute(i,luatexbase.attributes.randcolorattr))
         then
377
378
           color_push.data = randomcolorstring() -- color or grey string
           line.head = node.insert_before(line.head,i,node.copy(color_push))
379
380
           node.insert_after(line.head,i,node.copy(color_pop))
381
         end
382
       end
383
    end
    return head
384
385 end
```

6.8 rickroll

Another tribute to pop culture. Either: substitute word-by-word as in pancake. OR: substitute each link to a youtube-rickroll ...

6.9 uppercasecolor

Loop through all the nodes and checking whether it is uppercase. If so (and also for small caps), color it.

```
386 uppercasecolor = function (head)
    for line in node.traverse_id(Hhead,head) do
      for upper in node.traverse_id(GLYPH,line.head) do
388
389
         if (((upper.char > 64) and (upper.char < 91)) or
             ((upper.char > 57424) and (upper.char < 57451))) then -- for small caps! nice
390
391
           color_push.data = randomcolorstring() -- color or grey string
           line.head = node.insert_before(line.head,upper,node.copy(color_push))
392
           node.insert_after(line.head,upper,node.copy(color_pop))
393
394
         end
       end
395
396
    end
    return head
397
398 end
```

6.10 colorstretch

This function displays the amount of stretching that has been done for each line of an arbitrary document. A well-typeset document should be equally grey over all lines, which is not always possible.

In fact, two boxes are drawn: The first (left) box shows the badness, i. e. the amount of stretching the spaces between words. Too much space results in ligth gray, whereas a too dense line is indicated by a dark grey box.

The second box is only usefull if microtypographic extensions are used, e.g. with the microtype package under LATEX. The box color then corresponds to the amount of font expansion in the line. This can be greatly used to show the positive effect of font expansion on the badness of a line!

The base structure of the following code is written by Paul Isambert. Thanks for the code and support, Paul!

Two booleans, keeptext, and colorexpansion, are used to control the behaviour of the function.

```
399 keeptext = true

400 colorexpansion = true

401

402 colorstretch_coloroffset = 0.5

403 colorstretch_colorrange = 0.5

404

405 colorstretchnumbers = true

406 drawstretchthreshold = 0.1

407 drawexpansionthreshold = 0.9
```

After setting the constants, the function starts. It receives the vertical list of the typeset paragraph as head, and loops through all horizontal lists.

If font expansion should be shown (colorexpansion == true), then the first glyph node is determined and its width compared with the width of the unexpanded glyph. This gives a measure for the expansion factor and is translated into a grey scale.

```
408 colorstretch = function (head)
409
410
    local f = font.getfont(font.current()).characters
    for line in node.traverse_id(Hhead,head) do
411
412
      local rule_bad = node.new(RULE)
413
414 if colorexpansion then -- if also the font expansion should be shown
        local g = line.head
           while not(g.id == 37) do
416
           g = g.next
417
418
           end
         exp_factor = g.width / f[g.char].width
419
         exp_color = colorstretch_coloroffset + (1-exp_factor)*10 .. " g"
420
```

```
rule_bad.width = 0.5*line.width -- we need two rules on each line!
421
422
       else
423
        rule_bad.width = line.width -- only the space expansion should be shown, only one rule
424
       end
Height and depth of the rules are adapted to print a closed grey pattern, so no white
interspace is left.
    The glue order and sign can be obtained directly and are translated into a grey scale.
       rule_bad.height = tex.baselineskip.width*4/5 -- this should give a better output
425
       rule_bad.depth = tex.baselineskip.width*1/5
426
427
       local glue_ratio = 0
428
429
       if line.glue_order == 0 then
430
         if line.glue_sign == 1 then
431
           glue_ratio = colorstretch_colorrange * math.min(line.glue_set,1)
432
         else
433
           glue_ratio = -colorstretch_colorrange * math.min(line.glue_set,1)
434
         end
435
       color_push.data = colorstretch_coloroffset + glue_ratio .. " g"
436
437
Now, we throw everything together in a way that works. Somehow ...
438 -- set up output
439
       local p = line.head
440
    -- a rule to immitate kerning all the way back
441
442
       local kern back = node.new(RULE)
       kern_back.width = -line.width
443
444
    -- if the text should still be displayed, the color and box nodes are inserted additionally
445
    -- and the head is set to the color node
446
       if keeptext then
447
         line.head = node.insert_before(line.head,line.head,node.copy(color_push))
448
       else
449
         node.flush_list(p)
450
         line.head = node.copy(color_push)
451
452
       node.insert_after(line.head,line.head,rule_bad) -- then the rule
453
       node.insert_after(line.head,line.head.next,node.copy(color_pop)) -- and then pop!
454
       tmpnode = node.insert_after(line.head,line.head.next.next,kern_back)
455
456
       -- then a rule with the expansion color
457
458
       if colorexpansion then -- if also the stretch/shrink of letters should be shown
459
         color_push.data = exp_color
        node.insert_after(line.head,tmpnode,node.copy(color_push))
460
        node.insert_after(line.head,tmpnode.next,node.copy(rule_bad))
461
```

```
462 node.insert_after(line.head,tmpnode.next.next,node.copy(color_pop))
463 end
```

Now we are ready with the boxes and stuff and everything. However, a very useful information might be the amount of stretching, not encoded as color, but the real value. In concreto, I mean: narrow boxes get one color, loose boxes get another one, but only if the badness is above a certain amount. This information is printed into the right-hand margin. The threshold is user-adjustable.

```
if colorstretchnumbers then
464
465
         j = 1
466
         glue_ratio_output = {}
         for s in string.utfvalues(math.abs(glue_ratio)) do -- using math.abs here gets us rid of the
467
           local char = unicode.utf8.char(s)
468
           glue_ratio_output[j] = node.new(37,1)
469
470
           glue_ratio_output[j].font = font.current()
471
           glue_ratio_output[j].char = s
           j = j+1
472
473
         end
474
         if math.abs(glue_ratio) > drawstretchthreshold then
475
           if glue ratio < 0 then color push.data = "0.99 0 0 rg"
476
           else color_push.data = "0 0.99 0 rg" end
477
         else color_push.data = "0 0 0 rg"
         end
478
479
         node.insert_after(line.head,node.tail(line.head),node.copy(color_push))
480
481
         for i = 1, math.min(j-1,7) do
482
           node.insert_after(line.head,node.tail(line.head),glue_ratio_output[i])
483
         end
         node.insert_after(line.head,node.tail(line.head),node.copy(color_pop))
484
485
       end -- end of stretch number insertion
486
    end
487
    return head
488 end
```

And that's it!

6.11 draw a chicken

A *very* first, experimental implementation of a drawing of a chicken. The parameters should be consistent, easy to change and that monster should look more like a cute chicken. However, it is chicken, it is Lua, so it belongs into this package. So far, all numbers and positions are hard coded, this will of course change!

```
489 --

567 stroke()
568 end
```

7 Known Bugs

The behaviour of the \chickenize macro is under construction and everything it does so far is considered a feature.

babel Using chickenize with babel leads to a problem with the "character, as it is made active: When using \chickenizesetup after \begin{document}, you can not use "for strings, but you have to use '. No problem really, but take care of this.

8 To Dos

Some things that should be implemented but aren't so far or are very poor at the moment:

rainbowcolor should be more flexible – the angle of the rainbow should be easily adjustable.

pancakenize should do something funny.

chickenize should differ between character and punctuation.

swing swing dancing apes!

chickenmath chickenization of math mode
